

READ ME

We have created this project in JAVA. We have connected our database with CLI UI with a JDBC connection.

You will need Netbeans or eclipse or any other editor that supports java to run this. As well as a pulse Secure connection.

As the application will run you will be asked to choose one of the choices out of the 10. If you choose 1st option. Then you will again be asked to choose out of 17 choices. Which will display the tables that we created in the oracle database.
